

**Exp No: 9****Date:**

## **HADOOP**

### **SET UP A SINGLE HADOOP CLUSTER AND SHOW THE PROCESS USING WEB UI**

**AIM:**

To set-up one node Hadoop cluster.

**PROCEDURE:**

1. System Update
2. Install Java
3. Add a dedicated Hadoop user
4. Install SSH and setup SSH certificates
5. Check if SSH works
6. Install Hadoop
7. Modify Hadoop config files
8. Format Hadoop filesystem
9. Start Hadoop
10. Check Hadoop through web UI
11. Stop Hadoop

**THEORY**

Hadoop is an Apache open source framework written in java that allows distributed processing of large datasets across clusters of computers using simple programming models. A Hadoop frame-worked application works in an environment that provides distributed storage and computation across clusters of computers. Hadoop is designed to scale up from a single server to thousands of machines, each offering local computation and storage.

**HADOOP ARCHITECTURE**

Hadoop framework includes following four modules:

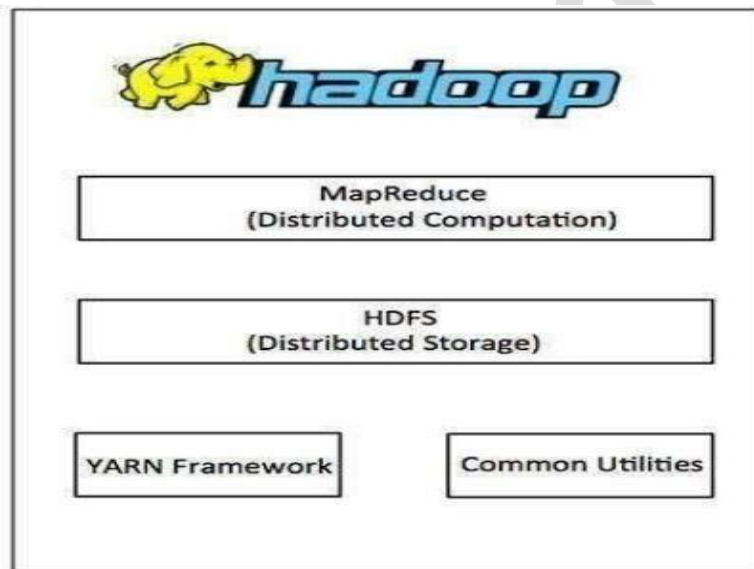

**Hadoop Common:** These are Java libraries and utilities required by other Hadoop modules. These libraries provide filesystem and OS level abstractions and contain the necessary Java files and scripts required to start Hadoop.

**Hadoop YARN:** This is a framework for job scheduling and cluster resource management.

**Hadoop Distributed File System (HDFS):** A distributed file system that provides high-throughput access to application data.

**Hadoop MapReduce:** This is a YARN-based system for parallel processing of large data sets.

We can use following diagram to depict these four components available in Hadoop framework.

## PROCEDURE

\$ nano ~/.bashrc

```

hadoop@kali: ~
File Actions Edit View Help
GNU nano 7.2 .bashrc

# Alias definitions.
# You may want to put all your additions into a separate file like
# ~/.bash_aliases, instead of adding them here directly.
# See /usr/share/doc/bash-doc/examples in the bash-doc package.

if [ -f ~/.bash_aliases ]; then
    . ~/.bash_aliases
fi

# enable programmable completion features (you don't need to enable
# this, if it's already enabled in /etc/bash.bashrc and /etc/profile
# sources /etc/bash.bashrc).
if ! shopt -oq posix; then
    if [ -f /usr/share/bash-completion/bash_completion ]; then
        . /usr/share/bash-completion/bash_completion
    elif [ -f /etc/bash_completion ]; then
        . /etc/bash_completion
    fi
fi

export JAVA_HOME=/usr/lib/jvm/jdk1.8.0_202
export PATH=$PATH:$JAVA_HOME/bin
export HADOOP_HOME=~/.hadoop
export PATH=$PATH:$HADOOP_HOME/bin
export PATH=$PATH:$HADOOP_HOME/sbin
export HADOOP_MAPRED_HOME=$HADOOP_HOME
export YARN_HOME=$HADOOP_HOME
export HADOOP_CONF_DIR=$HADOOP_HOME/etc/hadoop
export HADOOP_STREAMING=$HADOOP_HOME/share/hadoop/tools/lib/hadoop-streaming-3.4.0.jar
export HADOOP_LOG_DIR=$HADOOP_HOME/logs
export PDSH_RCMD_TYPE=ssh

GNU nano 7.2 /home/hadoop/hadoop/etc/hadoop/hadoop-env.sh

##
## Precedence rules:
## (yarn-env.sh|hdfs-env.sh) > hadoop-env.sh > hard-coded defaults
## (YARN_*/HDFS_*) > HADOOP_* > hard-coded defaults
##
# Many of the options here are built from the perspective that users
# may want to provide OVERRIDING values on the command line.
# For example:
#
# JAVA_HOME=/usr/java/testing/hdfs dfs -ls
#
# Therefore, the vast majority (BUT NOT ALL!) of these defaults
# are configured for substitution and not append. If append
# is preferable, modify this file accordingly.
##
# Generic settings for HADOOP
##
# Technically, the only required environment variable is JAVA_HOME.
# All others are optional. However, the defaults are probably not
# preferred. Many sites configure these options outside of Hadoop,
# such as in /etc/profile.d
#
# The java implementation to use. By default, this environment
# variable is REQUIRED on ALL platforms except OS X!
export JAVA_HOME=/usr/lib/jvm/jdk1.8.0_202
#
# The language environment in which Hadoop runs. Use the English
# environment to ensure that logs are printed as expected.
export LANG=en-US.UTF-8
#
# Location of Hadoop. By default, Hadoop will attempt to determine
# this location based upon its execution path.
# export HADOOP_HOME=
#
# Location of Hadoop's configuration information. I.e., where this
# file is living. If this is not defined, Hadoop will attempt to
# locate it based upon its execution path.
#
# NOTE: It is recommended that this variable not be set here but in
# /etc/profile.d or equivalent. Some options (such as
# --config) may react strangely otherwise.
# export HADOOP_CONF_DIR=${HADOOP_HOME}/etc/hadoop
